

Short

DIA is an open-source oracle platform that allows market actors to supply, share and use transparent, crowd-verified price data and oracles for DeFi applications.

Medium

DIA is an open-source data and oracle platform that allows Defi applications and other market actors to supply, share and use transparent, crowd-verified price data and oracles.

Long

DIA (Decentralised Information Asset) is an open-source data and oracle platform for the DeFi ecosystem. DIA leverages crypto-economic incentives to drive supply, share and use transparent, crowd-verified price data and oracles on financial and digital assets.

Longer

DIA (Decentralised Information Asset) is an open-source, financial information platform that leverages crypto economic incentives to source and validate data and oracles. The DIA platform provides the infrastructure for market actors to supply, validate, use and share financial data. Founded in 2018 as a Swiss-based non-profit association, DIA's mission is to democratise access to financial data, similar to what Wikipedia has done in the broader information space with regard to central encyclopaedias. DIA's data sources and methodologies are transparent and publicly accessible for everyone. This will create a level playing field and break down barriers to entry for both the traditional and decentralised financial markets.
